

Week 1- Python Basics

This week I focused on fundamentals of Python like understanding its syntax, basic data types , different loops etc. I practiced some random questions on my own to learn application of the concepts that I learned.

The topics that I learned are listed below-

- Syntax- unlike C++ indentation in python matters
- Input/Output- How to take input and how to print anything.
- Comments- How to add single line and multi-line comments.
- Data Types – int, float, string, Boolean, list, tuple, dictionary, set, frozenset.
I also learned how to change one datatype to another.
- If Else loop- if, elif, else
- Operators- +,-,/,//,*,** and comparison operator also >,<==,!=
- For loop- (indentation matters)
- While loop
- Range

I have attached few python codes that I practiced after understanding fundamentals.
